

INTRODUCING!

CYGNUS 405

Automatic Printer Switch (APS)

A simple solution to allow both PRS and UTS tickets to be issued from the same counter, thereby facilitating PRS-UTS integration

Features

- Automatically routes data from the terminal's printer port to the PRS or UTS ticket printer under software control.
- No changes required to existing PRS application. The UTS application can incorporate software for controlling the APS.
- "Manual bypass" mode allows traffic to be permanently routed to either of the two printers.
- "Idle time out", "default port" and "filtering" features simplify migration from a single application system to an integrated PRS-UTS system.
- Easily configurable using switches. Front panel status indicators. Rugged, compact design.
- Design incorporates Cygnus' knowledge of Railway applications gathered during its 17 years of association with them.
